

1  
2 **ABSTRACT**

3       In a first exemplary media implementation, one or more processor-  
4 accessible media include processor-executable instructions that, when executed,  
5 direct a device to perform actions including: comparing an accuracy indicator to  
6 at least one threshold, the accuracy indicator corresponding to a reference  
7 macroblock selected for a target macroblock; ascertaining a refinement case from  
8 multiple refinement cases based on the comparing, each refinement case of the  
9 multiple refinement cases defining multiple test points in relation to the reference  
10 macroblock; and analyzing the ascertained refinement case with regard to the  
11 target macroblock. In a second exemplary media implementation, one or more  
12 media include processor-executable instructions that, when executed, direct a  
13 device to perform actions including: determining if two chrominance sums have  
14 magnitudes that are each less than a first product and four luminance sums have  
15 magnitudes that are each less than a second product; and if so, forwarding all zero  
16 values for a macroblock.
